

# Demography as Strategic Foresight

**Richard Cincotta**

rcincotta@stimson.org

*Woodrow Wilson Global Fellow*

Dir., Global Political Demography Program,  
The Stimson Center

**AFSG, Crystal City**

**Presented: March 7, 2019**

## Objectives:

1. Provide **quick background** on the *age-structural theory of state behavior*.
2. Review its **5 basic statistical relationships** in “*age-structural time*”.
3. Review its **potential for statistical forecasting**.
4. *If there is time*, review its **10 fundamental “rules”**.

*Background:* Origins of age-structural theory

# The Anticipatory Fields of Intelligence

*(Estimative, Early Warning, Foresight)*

## Features:

- **Reductionist:** Focuses on a fundamental relationship and builds up; appears unconcerned with causality.
- **Core of the model is demographic:** relies on estimates and projections by the UN Population Division (alternatively, the US Census Bureau, International Program Center).
- **Relies heavily on the scientific method:** Models generated by age-structural modeling (logistic regression in the age-structural domain), and then tested, modified, retested.

## Key Points

- **Age structural transition:** transition from youthful to more mature age structures (the *Global Trends* four phases).
- **Age-structural domain** (*age-structural time* vs. chronological time).
- **Age-structural theory of state behavior** (generating social, economic, and political expectations at various stages of the age-structural domain).
- **Age-structural theory is a scientific program** (testable statistical expectations) which differentiates it from explanatory narratives that are untestable.
- **Ideology (politico-secular as well as politico-religious)** can over-power the expectations associated with demography. Some strong religious ideologies manipulate fertility (and therefore, age structure).

## **Background:** Elements of age-structural theory and their audience

- **Statistical Element:** Generating continuous age-structural functions associated with transitions/events. (driven by the computational and non-computational elements).
- **Computational Element:** Generating tests of theory and forecasts (checking the statistical and non-computational elements).
- **Non-computational Element:** Generating fundamental expectations for analysts, “the 10 Rules.” Separating which countries perform as expected from those that are “behaving unexpectedly” (checking the statistical and computational elements).

# The Age-structural Transition

## 2015

Data: UN Population Division, 2015 Rev.

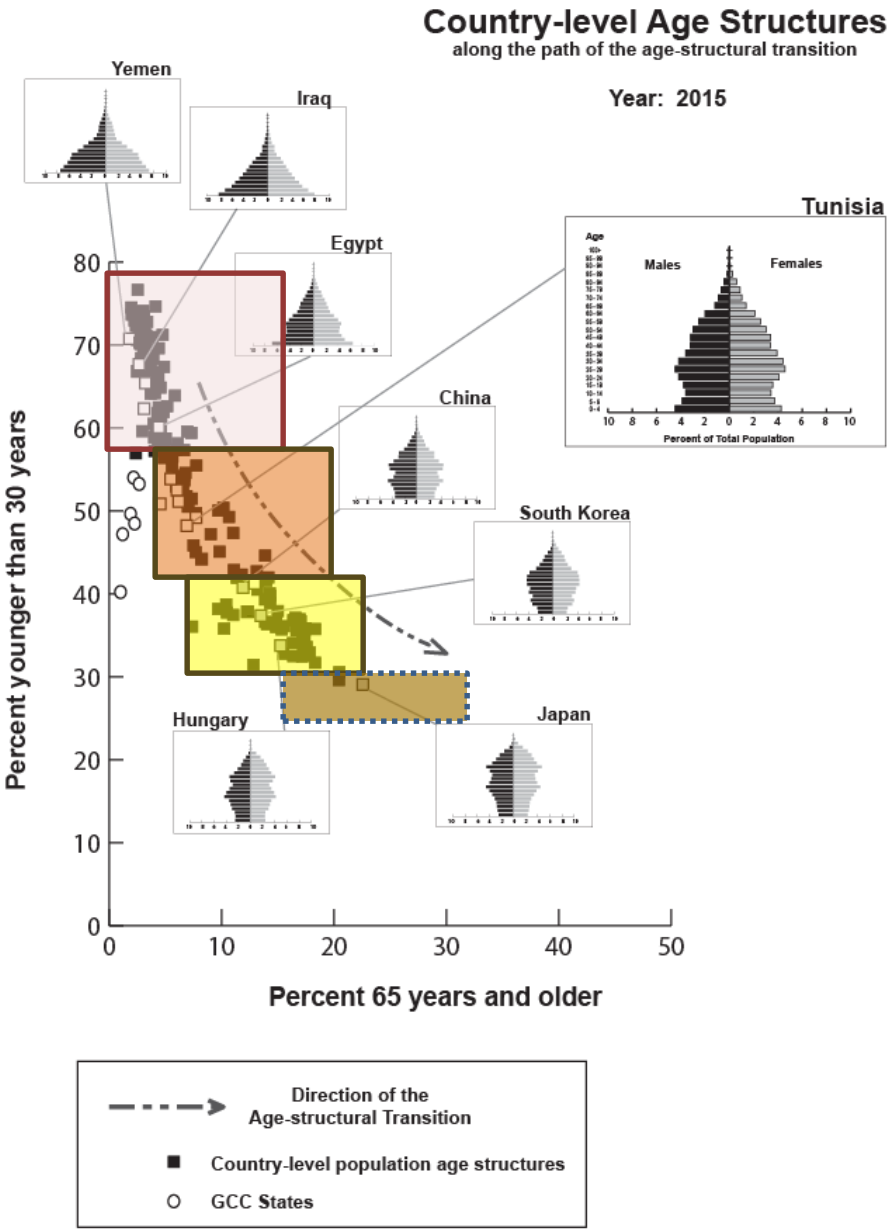

# The Age-structural Transition

## 2015

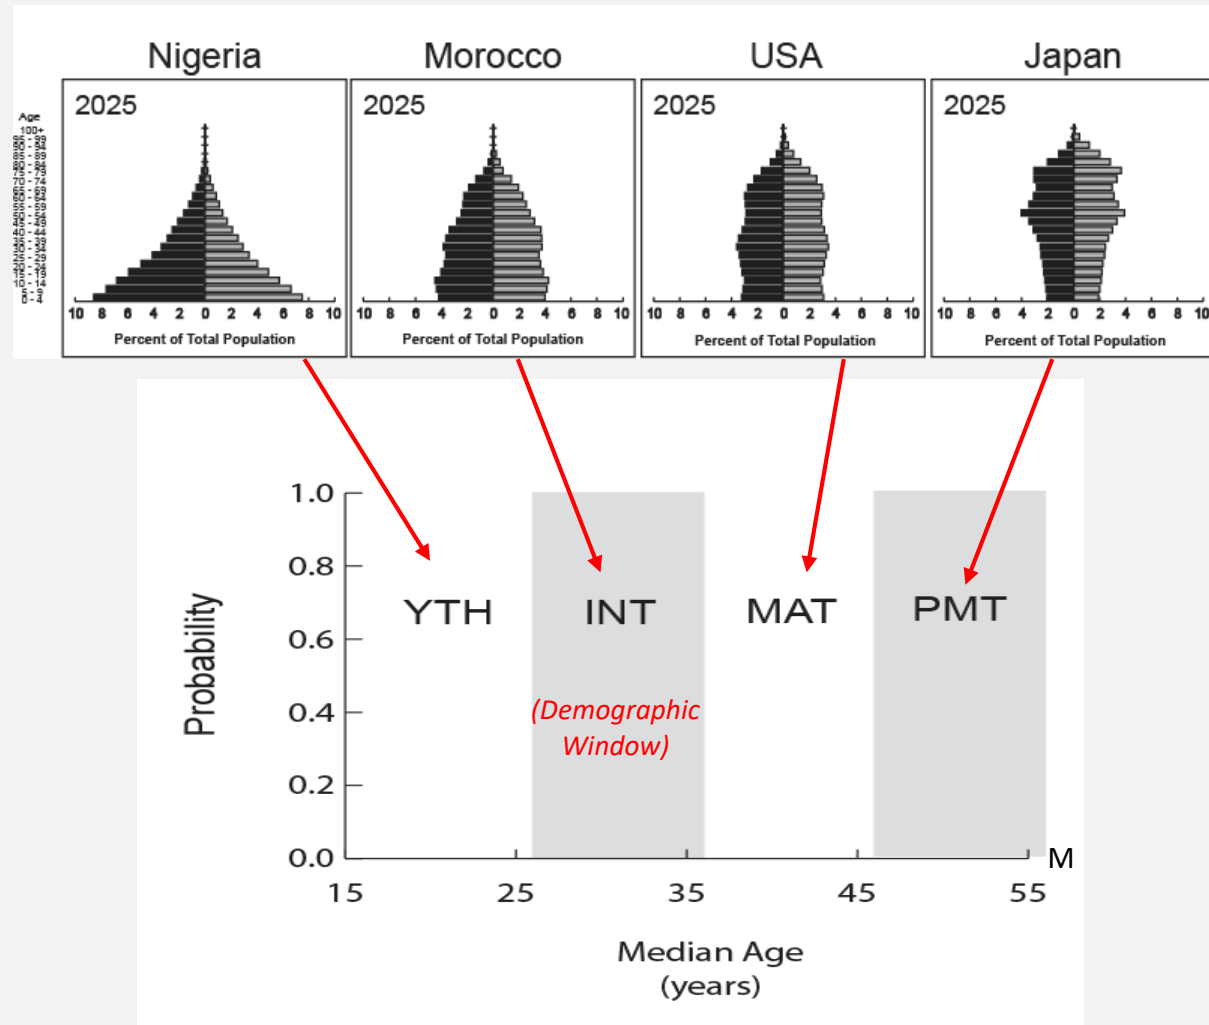

Data: UN Population Division, 2017 Rev.

## 4 Phases of the Age-structural Transition

Median age (in years)

- Youthful  $\leq 25.5$
- Intermediate 25.6 to 35.5
- Mature 35.6 to 45.5
- Post-mature  $\geq 45.6$

Age-structural Timeline (M)

Age-structural Transition

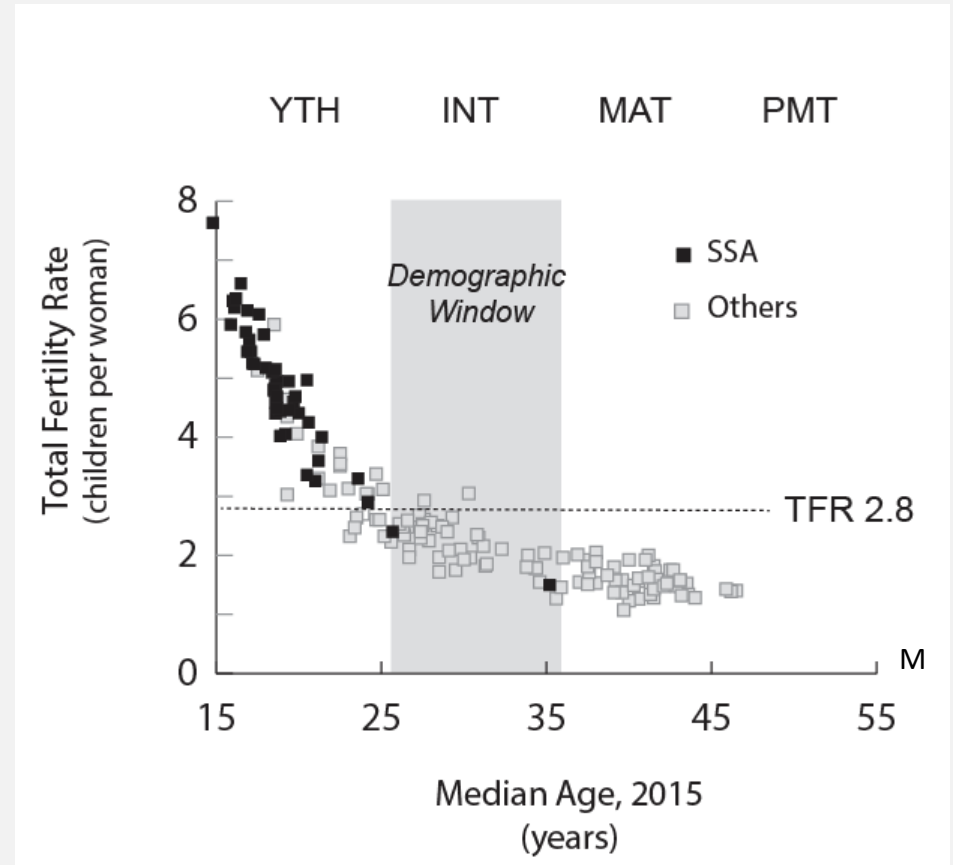

## NIC's Four Age-structural Phases

- **Youthful (YTH):** rapid growth among children, adolescents, young adults; low levels of human capital and institutional capacity (typically low legitimacy). Difficult to generate legitimacy from institutions (because of the large load on them, and low levels of human capital)
- **Intermediate (INT):** *The demographic window*; low levels of dependency; rapidly increasing human capital and institutional capacity (typically gains in legitimacy).
- **Mature (MAT):** fading of the demographic advantages; society and economy directed by the institution and capacity generated during the window. Need to be preparing institutions/society for the next phase.
- **Post-mature (PMT):** challenges from large proportion of seniors in adult population; declining workforce size (maybe); unprepared institutions (?); ethnic shifts due to immigration (?).

Phase	Institutional Capacity	Performance
Youthful (YTH)	Weak	Low or Lower-middle
Intermediate (INT)	Upwardly mobile	Lower Middle → Upper Middle
Mature (MAT)	Depends on INT institution building	Upper Middle or High
Post-mature (PMT)	Depends on MAT performance	???

## Sub-Saharan Africa and the Demographic Window

TFR, 2010-15 vs. Median Age, 2015

Age-structural  
Transition

## Exceptional factors:

- States with populations less 5.0 million (**small-population states** [SPS])
- States that are reliant on oil and/or mineral wealth (rents >15% of GDP, **resource reliant states** [RRS])
- Single-party regimes (**ideological political monopolies** [IPM]).
- States that are a composite of **demographically dissimilar nations** [DDN] (large gaps in fertility, growth, age-related mortality, age structure, net migration).

# Tunisia

Median age, 17.1

Pop: 4.5 million

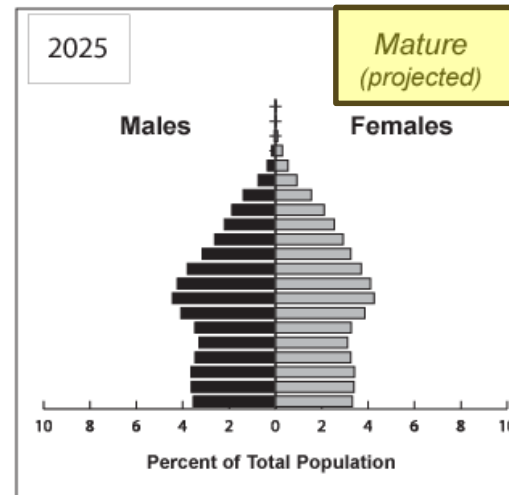

Median age, 20.9

Pop.: 8.2 million

Median age, 29.0

Pop.: 10.6 million

Median age, 35.6

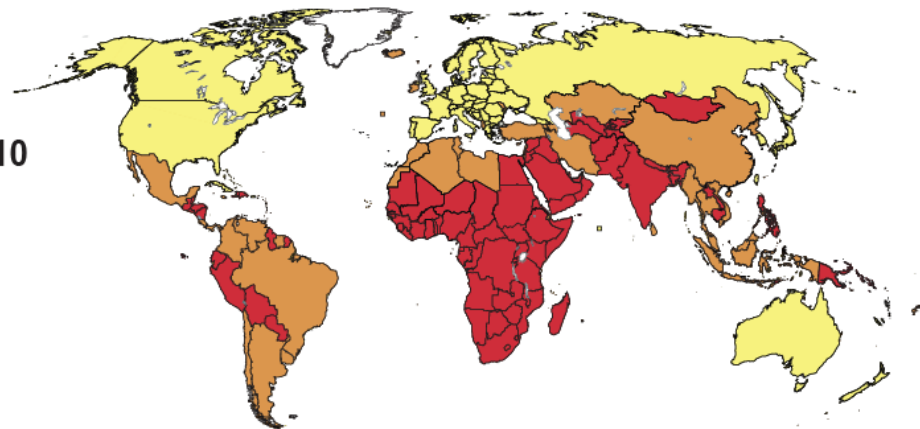

Pop.: 12.3 million

Age-structural Transition

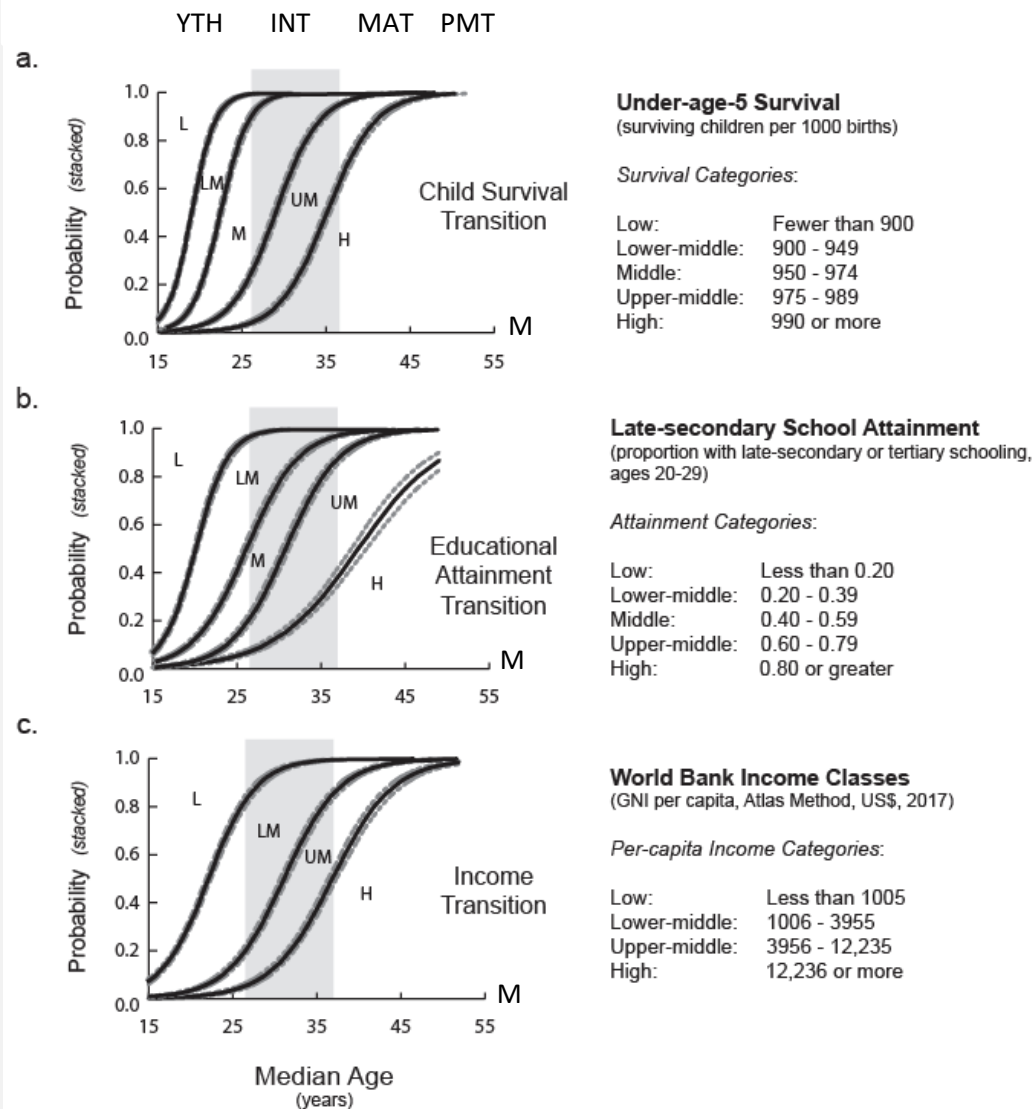

# Age Structure & Development

## Transitions in:

Child survival (UN Pop. Div./WHO)

Late-secondary educational attainment (IIASA/VID)

Per-capita income (World Bank, WDI)

## Political Liberalization Transition

Freedom House freedom status categories, published annually by Freedom House, based on the average of their political rights (PR) and civil liberties (CL) scores (average is called the freedom score).

FREE: Freedom Scores 2.5 to 1.0  
PARTLY FREE: Freedom Scores 5.0 to 3.0  
NOT FREE: Freedom Scores 7.0 to 5.5

Data: Freedom House (2018), UNPD (2017)

## Political Stability Transition

UCDP/PRIO Armed Conflict Database,  
intra-state, government-focused conflicts  
(>25 battle-related deaths per year, where  
the state is one of the armed parties)

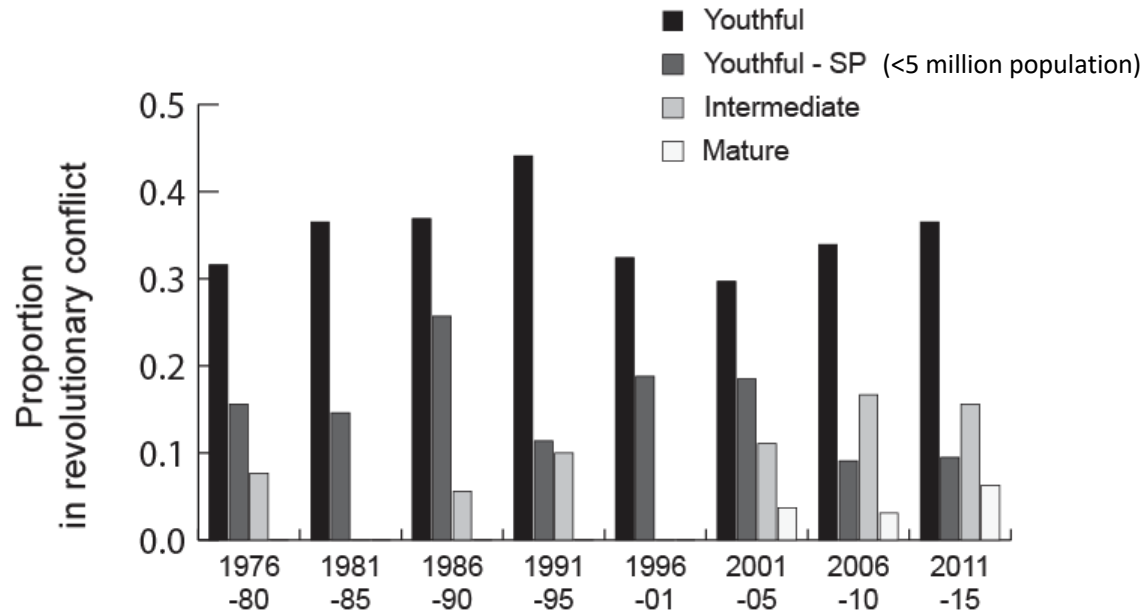

Note: Not a separatist (territorial) conflict.

Conflict History Classes (same type of conflict  
during prior 4-year)

$R_{Abs}$ :	0 years of conflict (absence)
$R_{Int}$ :	1 or 2 years of conflict (intermittence)
$R_{Per}$ :	3 or 4 years of conflict (persistence)

Data: UCDP/PRIO (2017), UNPD (2017)

## Revolutionary Conflict: empirical evidence

## Territorial (ethnic separatist) Conflicts: Theory

4-year conflict history types

*Onset: 0 conflict yrs.*

*Intermittent: 1 or 2 conflict yrs.*

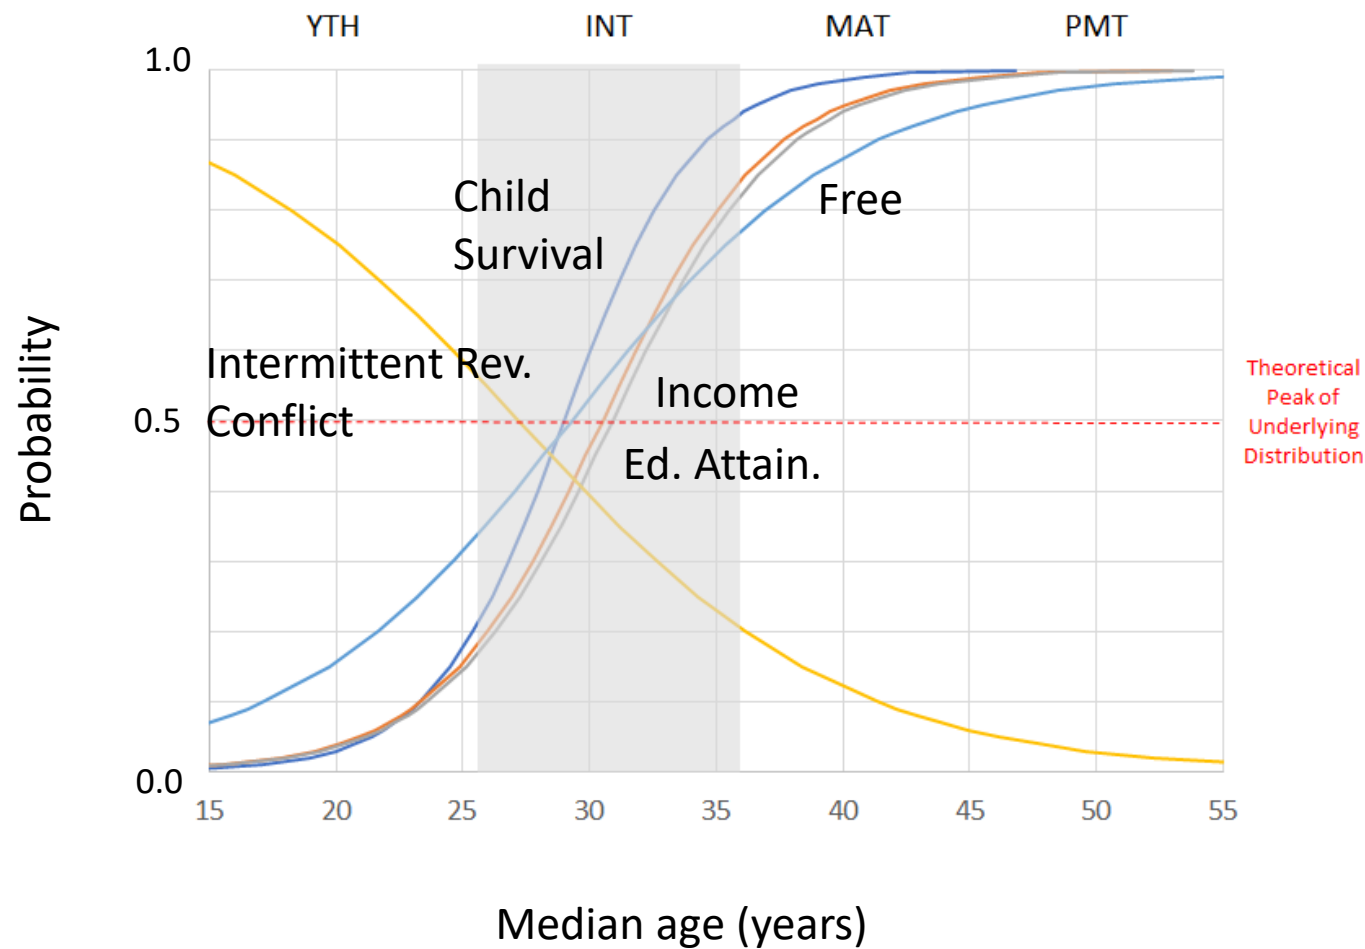

*Persistent: 3 or 4 conflict yrs.*

Cincotta, in press

## Territorial Conflict: empirical evidence

Demographic Window: Upper-Middle<sub>50</sub>

*Products:* Forecasts and related materials

## Issues:

- **Working in age-structural time** (an advantage). Coming up with a narrative (a disadvantage).
- **Law of small numbers**: statistical issue; regions more effective than individual states.
- **Other factors**: Regimes; ideologies; separatist conflicts (and other sub-state issues); neighborhood influences.
- **Models naïve to sub-state data**: Missing sub-state demography and other sub-state data.

*Statistical facts & working hypotheses*

*(helpful)*

## Eight Rules of Political Demography (1 through 4)

1. **Expect states at the top of the list**, the most age-structurally mature, to experience the best chance of being a liberal democracy – that is, to be assessed as FREE in Freedom House's annual Freedom in the World global survey (most analysts consider FREE status to be synonymous with liberal democracy).
2. **Expect states that have a youthful age structure** (below a median age of 25.5 years) to be the least likely to be assessed as FREE and the most likely to be engaged in intra-state conflict of either low or high intensity, as measured by the Uppsala Conflict Data Program.
3. **Where a revolution occurs in a state with a youthful population**, expect either the authoritarian regime to remain in power or to be replaced by another authoritarian regime (typically NOT FREE or low-level PARTLY FREE, as measured by Freedom House).
4. **Expect states that achieve FREE while youthful to lose this rating** within a decade. There is a long history of this effect; Mali is a recent example.

## Eight Rules of Political Demography (5 through 8)

5. Expect states with a population of less than 5 million to be the most likely to break rules 1, 2, 3, and 4 (see the UN Population Division for population data).
6. Expect states that are ruled by an ideological single-party regime or another type of ideological political monopoly – for example, Iran's theocracy – to mature without liberalization. China and North Korea are other prominent examples, and so far, have had no successional issues.
7. Expect states led by a revolutionary leader (Cuba under Castro, Venezuela under Chavez) or a charismatic reformer (Russia under Putin, Turkey under Erdogan, Singapore under Lee Kwan Yu) to resist attaining FREE. Expect these regimes to have successional problems.
8. Expect a state ruled by a military junta/ruler or absolute monarch to yield to a more democratic regime before the population attains a mature age-structure (before a median age of 35.5 years).

*Causal narratives (optional)*

## Why does median age predict development?
